

Here's what FMC, your source for motorhoming information, had to say about our BatteryMINDer® in their April 2002 issue . . .

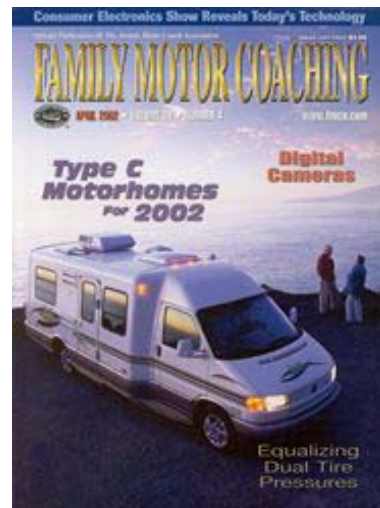

Battery Charger / Conditioner-Desulphator

“VDC Electronics offers the BatteryMINDer automatic three-stage maintenance chargers plus desulphator conditioners. These units can handle up to six batteries at a time, including 12-volt and 6-volt deep-cycle batteries, as well as maintenance-free, AGM, gel, and sealed-valve regulated batteries.”

“According to product literature, units for 12-volt (model 12041), 24-volt (model 24021), and 36-volt (model 36131) batteries produce high-frequency pulses that cause the sulfuric acid crystals (sulphation) to unbond and return to the cells' electrolyte. With desulphated plates, the batteries charge more quickly, are capable of delivering full power, and have an extended life. The second stage of the unit "floats" the battery at full charge without overcharging it. During the third stage, the battery is automatically desulphated, which company literature notes is the number one cause of early battery failure and diminished capacity or power. Battery test circuitry is included to predetermine the battery condition and state of charge.”

MSRP price for model 12041 is \$149.95 and \$159.95 for models 24021 and 36131. However, special pricing is available to callers who identify themselves as FMCA members. The units are covered by a 5-year "no-hassle" warranty.
